

HIGH PERFORMANCE MOLD STEELS FOR INJECTION OF REINFORCED PLASTICS

PLASTIC
MOULD STEEL

HIGH PERFORMANCE MOLD STEELS FOR INJECTION OF REINFORCED PLASTICS

Modern industrial parts production in mainly automotive and electronic industries is characterized by the trend to substitute metals by reinforced plastics. Being much lighter and therefore weight-saving, such plastic components help to reduce CO₂ emissions, which is a clear ecologic focus worldwide. Intricate geometries, thin wall-thicknesses and large areas of the parts are characteristics that call for a growing amount of glass or carbon fibers in the plastics to obtain sufficient stability.

Plastics reinforced by fibers tend to be much more abrasive than conventional plastics and thus may cause premature wear of an injection mold. In order to counteract excessive and early wear in molds, voestalpine BÖHLER Edelstahl is offering a wide variety of high-quality tooling steels that are setting new standards in the production of heavy-duty components made from reinforced plastics.

TRENDS AND REQUIREMENTS

- » New types of high performance plastics (GF, CF, fibre length, filler material)
- » Increasing wear resistance requirements on mold material
- » Increasing corrosion resistance of mold material
- » Complexity of parts increased (light weight construction)
- » Increase productivity through shorter cycle times (thermal conductivity)
- » Higher closing pressures and processing temperatures

PLASTIC MOLDING

EXAMPLE OF „POLYMERIC LEIGHT WEIGHT CONSTRUCTION“

Prototype:
Plastic steering case

- » Equal cost part made of 50% glass fiber reinforced PA (Ultramid® A3R) with metal inserts
- » Special FEM –Design modification
- » Service temperature: max. 125 °C
- » **50% weight savings**

WEAR MECHANISM

Fiber motion causes abrasive wear by

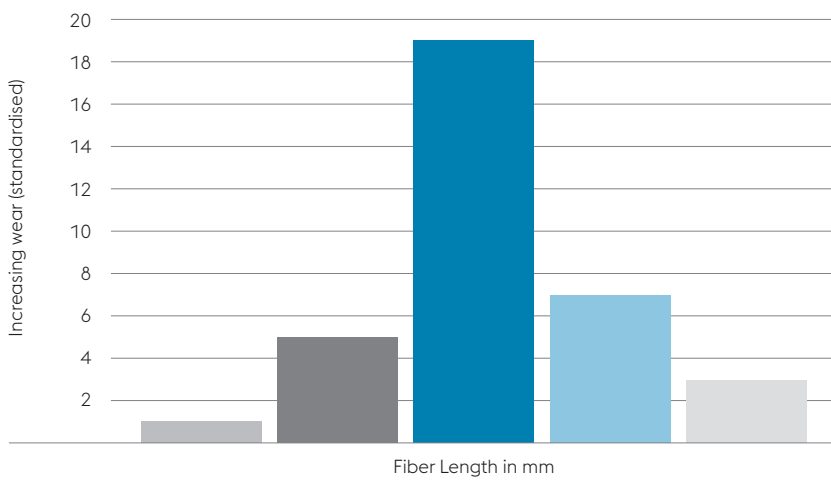

Beside glass fibers also glass balls, metal oxides (titanium oxide, chromium oxide), calcium carbonates, silica components (sand, quartz), ceramics are forcing abrasive wear.

INFLUENCING FACTORS

Fiber Length

Typical fiber diameter: 10 µm

- Length up to 200 µm
- 200 µm < L < 500 µm
- 500 µm < L < 1000 µm
- 1000 µm < L < 2000 µm
- Length > 2000 µm

HEAT TREATABLE, WEAR RESISTANT MOLD STEEL

The wear is determined either by mass loss or volumetrically by 3D measurement of the sample surfaces before the test and after injection of, for example, 25 kg or 50 kg of glass fiber reinforced plastic molding compound.

The wear apparatus for testing the abrasive / corrosive wear on the tribosystem polymer melt / steel is installed in the injection molding machine in the form of an injection molding tool. The wear samples, which have the same temperature as the melt, form a rectangular gap in which large local shear stresses and shear rates can be generated. The melt is injected through the wear gap and generates the material removal on the surfaces of the two wear samples (each 15 x 12 x 5 mm). The entire dosing volume of the plasticized molding compound is injected at a defined injection pressure, defined injection rate and a specified melt temperature.

The wear is determined by the material removal (mg / cm^2) or the material removal height (μm) before and after injected a defined amount of plastic melt.

Small Plates Wear Tests

Mean depth of abrasion or weight loss of the testing plates indicates the wear resistance.

EFFECT OF CORROSION AND ABRASION – LABORATORY TEST RESULTS K110 VS. M390 MICROCLEAR, RESULTS FROM PLATES WEAR TESTS

PA 66 + 30% GF/ 300°C

PES + 30% GF/ 400°C

Hardness

Facts

- » Filling materials and additional fibers in various plastic materials have an abrasive effect
- » Together with corrosive media (fission products,...) tribochemical wear system emerges

Abrasion

Free Cr

%	C	Cr	Mo	V	W
K110	1.55	11.80	0.80	0.95	
M390PM	1.90	20.00	1.00	4.00	0.60

Hardness (HRC)

K110*)	58
M390PM	61

Corrosion + Abrasion

Beside wear and corrosion resistance further important factors to choose the right material are:

- » Tool design (complex/simple, deep/shallow cavity, ...)
- » Tool size
- » Surface requirements on the mold

Additional aspects are for instance dimensional stability, edge stability, machinability, ability for coating....

Detailed recommendations have to be checked case by case.

BÖHLER K110

Electro Slag Remelting Production

ISOPLAST® ISODUR® ISOBLOC®

IMPROVED SERVICE LIFE DUE TO:

- Least possible inclusion content
- Lower micro and macro segregation
- Good homogeneity and a higher degree of purity
- Homogenic structure throughout the entire cross-section and bar length
- Producing larger bar dimensions at a constant carbide distribution
- Uniform dimensional stability
- Broad range of application owing to a high degree of toughness

Microstructure
BÖHLER K340
in ESR quality

Powder Metallurgical Production

MICROCLEAN®

FOR THE HIGHEST DEMANDS:

- Segregation free high performance steel
- Finest carbide distribution
- Highest metallurgical purity
- Isotropic properties
- Maximum wear resistance with a simultaneously higher toughness
- High degree of hardness
- Very good dimensional stability
- High compressive strength
